

Sirs: In reference to proposed high speed data on the power lines.

I have heard and seen the actual tests conducted by our Amateur Radio League, and conclude this would severely hamper our future ability to assist in disasters, and providing public services at no cost. As we will no longer be able to communicate with all the noise generated by these transmissions, our communications will be of a much more unreliable source. Is this what we really want?

Please have more independent studies on this before it is allowed to take place. You will find the ARRL tests to be correct.

Thank-you for your time. Bert F Benjaminson Amateur operator WB0N
